

I think that throughout the course, I've gained a better understanding of various coding techniques that can be used in Python. I've gained significant knowledge about the internal workings of Python through understanding what each of the dunder methods provided do, and this allows me to customize my classes to become as easy to use and understand as the built in Python classes are. I think that previously, I felt that Python was an extremely easy language to learn because of the lack of hard rules applied onto the programmer, but I've understood now that even without these preset rules such as typing and things similar to that, Python still has significant amount of rules and important implementations to understand because of the vast options you are given through Python.
